

Wolfgang Parak is Professor of Physics and Chemistry at the University of Hamburg, Germany, and also Leader of the Biofunctional Nanomaterials Unit at CIC biomaGUNE, San Sebastian, Spain. He was previously Professor of Experimental Physics at the Phillips University of Marburg, Germany. His research has focused on the interaction of nanoparticles with biological systems, through using the tools of chemistry, physics, and biology to gain fundamental insight into the complexities of the bio-nano interface. He has significantly contributed to the development of new surface chemistries of inorganic nanoparticles and towards the characterization of their physicochemical properties. In particular, the development of an amphiphilic polymer coating is nowadays used by many different groups worldwide. Nanoparticles with such high colloidal stability are the bases of experimentally correlating their physicochemical properties with their interaction with cells (involving uptake and cytotoxicity), which has been his research topic for the last 2 decades, in which he has achieved international recognition. He also pioneered the use of polymeric polyelectrolyte capsules fabricated by layer-by-layer assembly in biological applications (*in vitro* sensing and delivery). He is Associate Editor of the journal ACS Nano. Dr. Parak received his Ph.D. from the Ludwig Maximilians University in Munich, Germany, and also did post-doctoral research at the University of California, Berkeley.
